CONTENT

No.	Title	Page
i	Preface	xvii
ii	Keynote Speaker 1 Sustainable Community Development - Approaches, Opportunities and Challenges <i>Dr. Jim Cavaye</i> <i>Cavaye Community Development</i> <i>Toowoomba, Queensland, Australia</i>	1
iii	Keynote Speaker 2 Rethinking Development Ethics: A Fundamental Issues in Sustainable Community Development <i>Prof. Dr. Subhilhar Orang Kaya Harmaini</i> <i>Universitas Sumatera Utara</i> <i>Indonesia</i>	14
iv	Keynote Speaker 3 Local New Media for Equal & Sustainable Development : Case of Thai Telecentre <i>Kamolrat Intaratat</i> <i>Director of Communication & Development Knowledge Management Research Centre</i>	26
v	Keynote Speaker 4 Harnessing Human Resources and Institutions in Responding to Climate Change: Towards Sustainable Community Development <i>Bessie M. Burgos & Sharon P. Batin</i> <i>Manager & Project Coordinator, Southeast Asian Regional Center for Graduate Study and Research in Agriculture (SEARCA)</i>	35
vi	Keynote Speaker 5 The Role of Universiti Putra Malaysia (UPM) in Empowering Community in Sustainable Development <i>Nik Mustapha R. Abdullah, Md. Salleh Hassan, Musa Abu Hassan & Inon Beydha Lukman</i> <i>UPM Vice Chansellor</i>	45
Theme 1 : Regenerating Community		
1.	Towards A Sustainable Community Through A Sustainable University <i>Hamoon Khelghat-Doost, Y.T.M. Tunku Fatimah Firdaus Dato' Tunku Fariddudin & Zainal Abidin Sanusi</i>	59

2.	Factors Affecting Alumni Participation in Malaysia Towards Their Alma Mater: Alumni's Perspective <i>Chew Pei-Ni, Chua Tian Huat, Lim Cai Xuan and Chin Wai Yin</i>	73
3.	Transforming the Communities of Tomorrow <i>Rashika Sharma</i>	85
4.	Perception of UTM's Community Towards Sustainable Campus <i>Gobi Krishna a/l Sinniah, M. Rafee Majid</i>	95
5.	Community Enhancement Via Participatory Approach in Recovery: Determining Factors towards Enhancement of Tsunami-affected Community in Banda Aceh City, Indonesia <i>Grace Yuswita Harahap, Mohamed Amiruddin Fawzi Bahaudin, Nurwati Badarulzaman</i>	107
6.	Pilot Projects A Catalyst in Community Empowerment and Urban Regeneration <i>Hossein Fahimi Zadeh & Nasroullah Dehghan</i>	127
Theme 2: Productive Welfare		
7.	Factors Affecting Oil Palm Plantation More Attractive to Local Workers: A Preliminary Study in Tawau, Sabah <i>Alangseri A. K., Mohammad Amizi A., Assis K.</i>	139
8.	Developing Home Industry Grouper Hatchery Firms Towards Coastal Communities Regeneration In Bali <i>Cening Kardi</i>	147
9.	Instrument For Measuring Quality Of Life Of Employees In The Malaysian Public Sector <i>Nor Asiah Mahmood, Jegak Uli, Jamilah Othman, Bahaman Abu Samah, Noor Azman Ali, Md. Salleh Hj. Hassan, & Hayrol Azril Mohamed Shaffril</i>	159
10.	Tourism- A Means To Sustainable Community Development <i>Monu Rani Gupta</i>	173
11.	Tourism Development Through Capacities Development <i>Fariborz Aref, Asnarulkhadi Abu Samah</i>	185
12.	Weaving As A Sustainable Livelihood Option for the Tribal Women of Assam, Mulberry <i>Olee Bora, Rakhee Choudhur</i>	191
13.	Investigation Of Local Development Through Handicrafts And Tourism In The Case Of Iran <i>Sanaz Ebrahimnejad, Junaenah Sulehan, Abdul Hadi Bin Harman Shah, Samaneh Shahgaldi</i>	199

Theme 3: Economic Development		
14.	Necessity of Logistics in the Economic Development of Malaysia <i>Au Yong Hui Nee</i>	207
15.	The Plight of Domestic Workers in Bangalore-An Economic Study <i>M.Madhumathi</i>	219
16.	Characteristics of Successful Women Entrepreneurs and Economic Development in Nigeria <i>Ekpe Isidore</i>	233
17.	Development Anthropology's Perspectives on Sustainable Development of Eco-Cultural Tourism : A Case Study of Lugu Lake, Yunnan <i>Gang Chen</i>	241
18.	The Optimum Pastoral Unit Size; Economic Considerations in A Social Context <i>Hossein Barani</i>	255
19.	Community Development Efforts in The Provision of Rural Infrastructure in Nigeria: The Akure Region Experience <i>Julius Olujimi, Adetunji Adebayo</i>	265
20.	Analyzing The Elasticities of Electricity Price for Rural and Urban Area in Malaysia: Non-Linear Approach <i>Prof. Dr. Hussain Ali Bekhet, Nor Salwati Bt Othman</i>	277
21.	Innovating Success SMEs Manufacturing Sector in The New Economy <i>Othman Aman, Izaidin Abdul Majid</i>	293
22.	Sustainable Economic Development : Concept, Principles and Management from Islamic Perspective <i>Patmawati Ibrahim, Asmak Ab Rahman , Siti Arni Basir</i>	301
23.	Dropouts in Microcredit Financing: The Case of Amanah Ikhtiar Malaysia <i>Roseliza Hamid, Dr Asry Yusoff, Wan Marhaini Wan Omar</i>	315
24.	Halal Food Product Selection among the Muslim Consumers in Kota Bharu, Kelantan <i>Wan Marhaini Wan Omar, Azman Che Omar, Mohd Zainuri Muhammad</i>	323
25.	The Role of Qualitative Factors in Quantification of Development and the Feedback from The Southeast Asian Countries Experience <i>Kataryzna Anna Nawrot</i>	335
Theme 4 : Community Empowerment		
26.	Challenges Of Rural Councils In Sustainable Development In Iran <i>Hossein Imani Jajarmi, Ali Reza Karimi</i>	347

27.	Community Empowerment In Northern Thai Funeral Rituals: A Case Study Of Ban Dong Village, Lampang, Thailand <i>Busayagorn Teeraputtigunchai</i>	363
28.	Using Strengths Based Ways To Build Community And Contribute To Social Inclusion <i>Frank Tesoriero, Fiona Boyle, Linda Enright, Sandy Kavanagh</i>	373
29.	Cyber Café As A Community Development Tool: Ethical And Information Security Issues <i>Maslin Masrom, Abdo Ali Abdullah Al-Wosabi</i>	383
30.	The Roles Of Village Community Organisations In Implementing Family Planning Programmes. Case Studies In 4 Provinces In Indonesia <i>Rina Herartri</i>	399
31.	Community Participation And Public Sector Development Under Devolution Plan Case Study Of Citizen Community Board's In Pakistan <i>M. Shakil Ahmad, Dr. Noraini Bt. Abutalib</i>	409
32.	Community Empowerment Through Non-Governmental Organisations - A Case Study Of Tumkur District, India. <i>K.Sivachithappa</i>	421
33.	Success Indicators For Local Community Participation In Community-Based Tourism <i>Awangku Hassanal Bahar Pengiran Bagul & Datu Razali Datu Eranza</i>	431
34.	Are Development Workers Empowered To Empower Communities? The Case Of Botswana <i>Dr. Marietjie Van Der Merwe</i>	443
35.	Community Empowerment In Informal Settlements Planning Process And Characteristics Case Example: Shiraz - Iran <i>Nasroullah Dehghan & Hossein Fahimi Zadeh</i>	455
Theme 5 : Social Conflict		
36.	Intercultural Communication Conflict: Communication Patterns and Communication Conflict Management Strategies among Malaysian employers and Indonesian Foreign Domestic Helpers (Fdh) <i>Abdul Hadi Sulaiman, Jamilah Othman, Salleh Md. Hassan & Inon Beydha</i>	467
37.	Mediating Effect of Work-Family Psychological Contract on the Relationship between Organizational and Non-Organizational Factors, and Organizational Commitment <i>Abdul Mutalib Mohamed Azim & Aminah Ahmad</i>	487
38.	Sustainable Development in A Conflict-Ridden Indian State <i>Abu Nasar Saied Ahmed</i>	499

39.	Divide and Conquer: The Aggravation of Social Segregation by Gated Communities <i>Asnida Mohd Suhaimi</i>	515
40.	Community Empowerment and Conflict Approach of Community Development <i>Behzad Sahebzadeh, Nobaya Ahmad & Haslinda Abdullah</i>	525
41.	Ethno-Religious Crises and the Challenges of Sustainable Development in Nigeria <i>Dr R. Ibrahim Adebayo</i>	529
42.	The Perceptions of Malaysian Employers and Indonesian Maids Towards Their Communication Style at the Domestic Workplace <i>Inon Beydha Lukman, Jamilah Othman, Md. Salleh Hassan & Abd. Hadi Sulaiman</i>	543
43.	Cerro De San Pedro : Grass Roots Movements In Co - Operation and Conflict To Stop A Living City From Dissapearing <i>José G. Vargas-Hernández</i>	553
Theme 6 : Human and Social Capital Development		
44.	Religious Congruence among Malaysian Muslim Youth and its Implications for Sustainable Community Development <i>Steven Eric Krauss</i>	583
45.	Social Capital and Self-Help Approach in Community Development <i>Behzad Sahebzadeh, Nobaya Ahmad & Sharifah Norazizan Syed Abdullah</i>	595
46.	Relationship Between Human Development Competency and Job Performance <i>Neda Tiraeyari, Khairuddin Idris, Jegak Uli & Azimi Hamzah</i>	599
47.	A Correlational Analysis of Collective Social Capital and Sustainable Development Program Outcome in Iligan City, Philippines <i>Judelyn M. Salon</i>	613

Abstract

Farmers are key stakeholders in agricultural water management. Work collectively in water users association (WUA), they are responsible for conducting and financing the operation and maintenance (OM) of tidal irrigation at tertiary level to complement government responsibility at secondary and primary levels. In order to properly finance the OM, a participatory cost assessment of water service is considerably needed. The study aimed at assessing the cost of agricultural water service through a participatory approach in Telang Delta, the rice production center for tidal lowlands of South Sumatra, Indonesia. The study results in three cost estimates for agricultural water service, namely the supply cost, the economic cost, and the full cost. Three estimates for water service fee (WSF) are also derived for water users to contribute in financing the OM of tidal irrigation. The study suggests that the collection and management of WSF be handed to WUA.

Keywords: *water service, tidal lowland, agriculture*

INTRODUCTION

Indonesia has some lowlands with an estimated total area of about 33.4 million hectares (ha). These areas are predominantly located on the islands of Sumatra, Kalimantan (Indonesia's Borneo), Sulawesi (Celebes), and Papua. Out of 33.4 million ha, about 60 percent (approximately 20.1 million ha) are tidal lowlands and the remaining 40 percent are non-tidal lowlands. Tidal lowlands are mainly located along the lower reaches down to the coastal areas of these islands. Whilst, non-tidal

lowlands are located on the upper part to which river water fluctuations frequently cause inundation of these areas in the wet season.

Tidal lowland ecosystem bears many functions, from the uniqueness of landscape and the abundant of biodiversity that creates conservation functions, environmental protection functions against storm, saline intrusion, erosion and sedimentation, to the potential for resource based activities such as agriculture. Agriculture in tidal lowland in Indonesia has continuously become a choice to compensate the decrease in irrigated farm land area in Java due to conversion of irrigated land to non-agriculture activities. Conversion has taken 40,000 ha irrigated farm land per year in Java. During newly economic growth period of 2001-2003, total area of conversion has reached a tremendous number of 610,590 ha. In addition, further effort to improve the productivity of tidal lowland agriculture has become a must to compensate rice supply deficit due to prolonged drought and flooding which took turn since 1991. Either drought or flooding has caused harvesting to fail at approximately 90,000 ha per year. Rice supply deficit due to these constraints has put Indonesia as rice net-importer of about 4.5 million tons.

Expansion of farmland to tidal lowland areas has been carried out through reclamation. Reclamation of lowlands in Indonesia has reached 1.8 million ha. Out of 692,000 in Sumatra, 373,000 ha of which is located in South Sumatra Province. In spite of the quite large reclaimed area, its utilization for agriculture production is yet considered low. Until recently only about 30 percent of the area suitable for rice has reached the productivity above 5 tons per ha. In addition, only 10 percent of the area can be cultivated twice to three times a year. This diversity is due to the limited implementation of water management in tidal lowlands.

Agriculture water management in tidal lowland areas is directed towards fulfilling crop water need. It requires water structures for feeding, maintaining, and distributing water. Therefore, it also requires cost for operation and maintenance of the structures. This cost includes labor cost for gate operators for proper operation of gates and maintenance costs of canals and gates such as grass cutting, sediment removal, greasing, and rehabilitation of damaged structures.

In the past, operation and maintenance of water structures in tidal lowland areas were funded through government budget. Severe economic crises in the late nineties which cut government budget followed by the enactment of the Water Resource Law (UU No. 7/2004) require the contribution from water users, particularly farmers through so-called water service fee (WSF).

This study aims at assessing the cost of water service based on its cost components that provides estimate of WSF for agriculture activities in tidal lowlands. The scope of this study is limited to the scope of works of water users' association (WUA) which covers an area of a secondary block of 256 ha farmland.

WATER MANAGEMENT IN TIDAL LOWLAND AGRICULTURE

4 Water management is a key factor in tidal lowland agriculture. It has three-fold objectives of improving water distribution, recovering costs, and achieving efficient water distribution. In order to achieve these objectives, water infrastructures must be

properly operated and maintained. Therefore, besides the established guidelines for operation and maintenance (OM), the availability of fund is required to enable proper OM and ensure the achievement of water management objectives.

Despite its various objectives from improving water allocation and pollution control to achieving cost recovery of water resource use (Cornish et al., 2004), water management in tidal lowland agriculture is focused in fulfilling crop water needs. In achieving this objective, besides equipped with canals and structures, proper operation and maintenance of these canals and structures are also required.

Water management in tidal lowland to fulfill crop water needs has two levels, namely macro level and micro level water management. Macro level water management refers to the operation and maintenance of primary and secondary structures (primary and secondary canals and gates), whereas micro level deals with the tertiary structures that directly connected to the farmlands. Therefore, the latter is also known as on-farm water management.

Operation and maintenance of water infrastructures require institutions at all levels. Normally, the management of macro structures is the authority of the government (either central or local), whereas the management of tertiary structures is authorized to water users and water users' associations (WUAs). With this shared authority, responsibility of carrying out operation and maintenance is also shared.

A WUA is established to carry out operation and maintenance of tertiary structures within a secondary block of about 256 ha, which is bordered by two parallelized secondary canals. This area is considered as one water management unit. Within a water management unit, there are 17 tertiary canals which constitute 17 tertiary blocks. A tertiary block consists of 16 ha farm land lying along the side of a tertiary canal. Operation and maintenance of water infrastructures (tertiary gates and canals) takes place in these tertiary blocks. Considering the average ownership of farmland is 2 ha per farmers, each WUA in tidal lowland has an average of 128 members. Accordingly, the costs of carrying out the operation and maintenance of tertiary structures are born to water users within this association.

THE COST OF WATER MANAGEMENT TIDAL LOWLAND AGRICULTURE

Studies on water management are focused in various aspects from water pricing policies, water use efficiency (Singh, 2007; Gonzalez-Alvarez et al., 2007), cost recovery (Molle et al., 2008) to the environmental and institutional aspects of water charging (Bar-Shira et al., 2006; Esteban et al., 2008). In these studies, some cost concepts are used such as fixed costs and variable costs (Gonzalez-Alvarez et al., 2006), marginal social cost of water delivery (Bar-Shira et al., 2006), "environmentally optimal price" and "socially optimal price" (Esteban et al., 2008), and water demand (Schoengold et al., 2006).

In line with the above focus, the objectives of the study on water pricing and water charging also vary from determining the optimum use of water (Gonzalez-Alvarez et al., 2006), reducing water use (Bar-Shira et al., 2006), internalization of

environmental cost of water (Esteban et al., 2008), development of water market (Goetza et al., 2008), estimation of the best allocation of water (Latinopoulos, 2005), to water saving and improvement of efficiency (Molle et al., 2008).

In addition to the above, more specific assessments were directed to obtain the price elasticity of irrigation water demand (Schoengold et al., 2006) and rational pricing of irrigation water to enhance efficiency (Singh, 2007).

Referring mainly to the methods used in the works' of Gonzalez-Alvarez et al (2006), Bar-Shira et al (2006), Esteban et al (2008), and Molle et al (2008), the basis for estimating the cost of water (WSF) in this study were established to include different cost components that may be factored into a calculation of the costs of delivering water for agriculture. The proposed cost components are operation and maintenance (OM) costs, capital depreciation and replacement, opportunity costs, and environmental costs. Three types of water service fee (WSF) are estimated accordingly. WSF type 1 includes the costs associated with the supply of water (OM costs and capital depreciation and replacement). WSF type 2 includes all of the above costs plus the opportunity costs. WSF type 3 includes all of the above costs plus the environmental externalities associated with the use of water for agricultural purposes.

METHODOLOGY

In this study, a participatory approach is used. Farmers and officials of water user association (WUA) were involved actively throughout field data collection. Two main instruments were employed consecutively, namely *walkthrough* and focus group discussion (FGD). The former was used to understand current problems of agricultural water management in the study area. The later was used to obtain solutions to the problems through proposed operation and maintenance (OM) of infrastructures to achieve the objectives of agricultural water management in the area. In FGD, OM needs and financial means were discussed and consensus achieved was proposed.

RESULTS AND DISCUSSION

Based on the data from walkthrough and focus group discussion, results of this study are presented according to the cost components of water service in tidal lowland agriculture.

Operation and Maintenance Costs

Operation of gates is technically carried out by gates keepers. A gate keeper is in charge of opening and closing of two tertiary gates at each end of a tertiary canal. In WUA management a gate keeper is the head of a tertiary block. A gate keeper operates tertiary gates according to the following conditions: types of crop, crop growth stage, tide, rainfall, and farming activities (fertilizing, pesticide spraying, weeding, harvesting). Therefore, in doing so he frequently coordinates with his member farmers prior to operating the gates.

Maintenance of water infrastructures (tertiary gates and canals) consists of the following activities: (1) grass cutting and cleaning of canal banks, (2) sediment

removal, (3) gates repair, (4) gates replacement. According to the need, grass cutting and cleaning of canal banks are carried out as many as 3 times per year at the beginning of each planting season. Sediment removal is done once every year. Minor damage on gates is repaired immediately, while replacement of gates is estimated once in 10 year since tertiary gates are made of fiberglass.

Up to now, most of the operation and maintenance of water infrastructures have been carried out by WUA officials and members through so-called 'gotong-royong', which means working together as social responsibility as members of WUA. Within this system, almost no financial means is involved. Financial cost when applies is shared among members. The following costs are estimated to indicate financial cost of operation and maintenance of water infrastructures within a tertiary block.

Table 1: Financial costs of operation and maintenance of water infrastructures within a tertiary block per year

Item	Frequency	Unit	Unit Cost (Rp)	Cost (Rp)
Operation:				
Salary of the gate keeper	1	year	500,000	500,000
Maintenance:				
1. Grass cutting and cleaning of canal banks	3 times/year	4 man day	50,000	600,000
2. Sediment removal	1 time/year	8 man day	50,000	400,000
3. Gates repair	Incidental	-	-	100,000
4. Gates replacement ¹	1 time/10 year	1	4,000,000	(400,000)
Total				1,600,000

Note: ¹Gates replacement is part of maintenance, but its cost is counted in the cost of capital (investment cost). Therefore, number between parentheses is not counted.

Depreciation and Replacement Costs

Capital depreciation and replacement is derived from investment costs of water infrastructures. Investment costs are amount of money spent at the first installation of tertiary gates. These costs include provision cost of 2 tertiary gates and 2 culverts for every tertiary canal and construction cost of gates and culverts. Breakdown of investment costs is presented in Table 2. Gates need to be replaced once in 10 year, whereas culverts should be replaced after 20 year installed. Following the replacement of culverts, reconstruction must be done once in 20 year.

Management Costs

Management cost of WUA is the expenditures made to carry out the organizational functions of WUA which include the salary of officials, administration cost, and spending for meeting and coordination. The breakdown of WUA management cost is presented in Table 3.

Table 2: Investment costs and annual depreciation of water infrastructures at a tertiary canal

Item	Quantity	Unit Cost (Rp)	Cost (Rp)	Age (years)	Depreciation (Rp/year)
Provision cost:					

1. Gates	2	4,000,000	8,000,000	10	800,000
2. Culverts	2	8,000,000	16,000,000	20	800,000
Total A			24,000,000		1,600,000
Construction cost (once in 20 year):					
1. Building materials	1	26,000,000	26,000,000		
2. Labor	112 man day	50,000	5,600,000		
Total B			31,600,000		1,580,000
Total A and B			55,600,000		3,180,000

Table 3: Breakdown of WUA management cost per year

Cost Components	Volume	Unit	Unit Cost (Rp)	Cost (Rp)
Salary:				
1. Head	1	man year	1,000,000	1,000,000
2. Secretary	1	man year	750,000	750,000
3. Treasurer	1	man year	750,000	750,000
4. Gate keepers ¹	16	man year	500,000	(8,000,000)
Administration cost	1	year	100,000	100,000
Meeting & coordination:				
1. Meeting of officials	12		100,000	1,200,000
2. Plenary	1		300,000	300,000
Total				4,100,000

Note: ¹ Has been counted in operational cost

Opportunity Costs

In addition to the above financial costs, an economic cost of water service is also estimated using the concept of opportunity cost. Thomas and Maurice (2008) proposed that opportunity cost is the cost of using resources in production. In this case, opportunity cost is the cost of using the money for the payment of WSF estimated based on the cost of water supply which amounted Rp 315,000 per hectare per year (Rp 1,600,000/16 ha + Rp 3,180,000/16 ha + Rp 4,100,000/256 ha). Therefore, the estimated amount of opportunity cost is Rp 31,500 per year, which is the annual interest rate (assuming 10 percent) from that amount.

External Costs

External costs are costs imposed to water users for the internalization of externalities in water management at tertiary blocks. The externalities involved in the operation and maintenance of water infrastructures at tertiary blocks is the negative impacts from fertilizer and pesticide residuals discharged to the secondary canals from the farmland through the tertiary canals. As a result, water in the secondary canals which was previously utilized for drinking is no longer safe. The external cost associated with this is estimated as avoidance cost of not drinking the contaminated water. Therefore, it is the cost of consuming bottled water for at least three months, a period when canal water is undrinkable due to chemical contamination. According to the data, each household with 4 members consumes 6 liter per day. In 3 months for the total of 128 households, the amount of bottled water consumed is 69,120 liters. This

amount of avoidance cost is for a secondary block similar to one water management unit.

The use of avoidance cost, however, tends to be overestimated since the price of bottled water does not only include treatment cost in order to make the water drinkable. It also includes other costs such as packaging costs, marketing costs, profit of the owners, etc. In order to approach the actual external cost of the contaminated canal water, ideally a treatment cost is used. Treatment cost is the amount of money needed to improve the quality of contaminated canal water to the level that avoids external cost. However, the pollution level of water in irrigation canal was not easy to detect as reported by Bakri et al. (2006). As a result, treatment cost can not be easily formulated. Consequently, avoidance cost as has been discussed is used as a proxy for the external cost in case of tidal lowland agriculture.

Water Service Fee Estimation in Tidal Lowland Agriculture

Water service fee is imposed to water users on area basis. In this case, WSF is a fee for every hectare farmland served by the existing water infrastructures. Therefore, WSF is the summation of all cost components that are required to carry out all of water management activities. Table 4 presents the summary of the costs of water service which includes operation and maintenance (OM) costs, capital depreciation and replacement costs, WUA management costs, opportunity cost, and external cost or avoidance cost.

As discussed earlier, OM costs are estimated for one tertiary block which covers an area of 16 ha. Similarly, capital depreciation and replacement costs are calculated with reference to a tertiary block. WUA management costs are estimated for the whole area of its service which is a secondary block of 256 ha farmland. The summation of these three costs components with reference to its respective block indicates WSF of the first type (notified as WSF_1).

The estimation of opportunity cost is based on individual farmland. As discussed earlier, opportunity cost is estimated as the interest rate of the amount of money forgone for the payment of WSF_1 . Therefore, opportunity cost is applied for each ha of farmland. The summation of opportunity cost to WSF_1 indicates WSF of the second type (notified as WSF_2).

External cost is estimated based on avoidance costs not to consume unsafe water in the secondary canal due to fertilizers and pesticides contamination from the farmlands. Therefore, it is applied for 256 ha farmland served by the secondary canal. The summation of avoidance cost to WSF_2 indicates WSF of the third type (notified as WSF_3).

Table 4: Summary of costs of water service (per year) and WSF estimates (per ha per year)

Type of Cost	Cost Components	Block Area Applies		Total (Rp)	WSF (Rp/ha/year)
		Tertiary	Secondary		
Supply Cost	OM cost	1,600,000		80,580,000 (per 256 ha)	$WSF_1 =$ 315,000
	Capital depreciation and replacement cost	3,180,000			
	WUA management		4,100,000		

cost				
Economic Cost	Opportunity cost	31,500 (per ha)	88,644,000 (per 256 ha)	WSF ₂ = 346,500
Full Cost	Treatment cost of contaminated water in the canals	45,000 (per ha)	100,164,000 (per 256 ha)	WSF ₃ = 391,500

CONCLUSION

Assessing the cost of water service through stakeholder participation is a simple approach in estimating the cost of water service. Thus, it is also a simple way for the estimation of water service fee.

Water service fee is simply estimated by employing five cost components in accordance to achieving three-fold water management objectives which are improvement of water distribution, cost recovery, and achievement of efficient water distribution.

Water service fee of the first type is directed towards the improvement of water distribution. Thus, its cost components only include operation and maintenance costs, capital depreciation, and management cost. Second type WSF is meant to recover costs of water management. Therefore, its cost components also cover the opportunity cost in addition to the first three cost components. Finally, WSF of the third type is considered when the efficient water distribution is the target. It, therefore, covers all cost components involved in water management.
