ABSTRACT

Research to test the growth Cilosari of various rice varieties grown in oil palm plantations (12 year old) on dry land had been carried out from December 2015 to May 2016 in research station, Faculty of Agriculture, Sriwijaya University, Inderalaya. The field design used was split plot design. Based on the measurement of light intensity (low light) on palm oil of rows were as main plots ($G1 = 12.348$ lux meter, $G2 = 16.066$ lux meter, $G3 = 16.746$ lux meter, and $G4 = 12.812$ lux meter). The sub plots were rice varieties namely V1: Sirendah, V2: Sicantik, V3: Cilosari , V4: 4 bulan, V5: Sulrat Unsrati. All sub plots were placed in plot (3m x 3 m) with a position in the row of the palm oil plantations. The results of the analysis of variance on all observation parameters showed that there was an interaction significant of light intensity with rice varieties on plant height and green leaf degree/chlorophyl. There is no significant interaction for the percentage of seedling, number of tillers and time of flowering. Cilosari rice varieties have a growth percentage of more than 80%, Sulutan unsrati varieties had a number of tillers (10 stems) and a higher chlorophyl of leaves than other varieties. Upland rice of Cilosari and Sulutan unsrati, and 4 bulan as local rice varieties had a relatively good appearance of vegetative growth in low light conditions in palm oil plantation.

Keywords : light intensity, Oil palm, Plantation, Rice, up land

ABSTRAK

Penelitian tentang pertumbuhan berbagai varietas padi yang ditanam di gawangan kelapa sawit berumur 12 tahun di lahan kering telah dilaksanakan dari Desember 2015 sampai Mei 2016 di kebun riset, Fakultas Pertanian, Unsri, Inderalaya. Rancangan yang digunakan adalah spit plot design dimana intensitas cahaya pada gawangan kelapa sawit sebagai petak utama, $G1= 12.348$ luxmeter, $G2= 16.066$ luxmeter, $G3= 16.746$ luxmeter, dan $G4= 12.812$ luxmeter. Anak petak adalah varietas padi yaitu V1:Sirendah, V2: Sicantik,V3: Cilosari, V4: 4 Bulan, V5: Sulutan Unsrati. Semua anak petak ditempatkan dengan ukuran petak 3 m x 3 m dengan posisi di tengah gawangan kelapa sawit, dengan jumlah tanaman sampel per petak sebanyak 10 tanaman. Hasil analisis sidik ragam

Semnas LSO UNSRI <semnaslahansuboptimal@unsri.ac.id>

Kepada: mumarharun@unsri.ac.id

5 Oktober 2018 pukul 09.59

Yth. Bapak/Ibu/Saudara/Saudari

Nama (Terlampir)

Kami ucapan terima kasih atas partisipasi Bapak/Ibu/Saudara/Saudari, yang telah mendaftarkan abstrak untuk dipresentasikan pada Seminar Nasional Lahan Suboptimal 2018. Hasil evaluasi/review oleh Dewan Editor dan Peer Reviewer Abstrak Saudara dinyatakan Lulus untuk dipresentasikan dengan LoA terlampir. Saudara diharapkan paling lambat meng-upload makalah lengkap tanggal **7 Oktober 2018**. Template/panduan makalah di link: http://semnaslahansuboptimal.unsri.ac.id/?page_id=91

Dan Upload makalah di link:

http://semnaslahansuboptimal.unsri.ac.id/?page_id=3

Passwords: semnasLSO-2018

Demikianlah. Terima kasih

Salam

(Ketua Panitia)
