**ABSTRACT**

Research of hydrocracking of coal tar by using Ni/Mo sulfidated active zeolite catalyst had been done. The objectives of this research were to know the influence of catalyst temperature, hydrogen velocity and catalyst mass toward density and viscosity of hydrocracking product. The result showed that optimum condition was obtained at the lowest value of density and viscosity that were at 350°C of catalyst temperature, 2 mL/second of hydrogen velocity and 0.5 gram of catalyst mass with density and viscosity value 0.7691 g/mL and 0.5257 x 10<sup>6</sup> stokes.
