The *Journal of Indonesian Natural History* is published biannually by the Department of Biology at the Andalas University, Padang, Sumatra Barat, Indonesia, in collaboration with Copenhagen Zoo, Denmark. The Department of Biology at Andalas University is dedicated to educating Indonesian biologists in the study and conservation of Indonesia's biodiversity and natural history. Copenhagen Zoo, through its Research and Conservation Division, supports *in-situ* conservation in Southeast Asia by assisting local organizations and individuals who undertake research, capacity building and the implementation of conservation programmes and projects.

A rapid bird survey in Bukit Puar, Kerinci Seblat National Park; with notes on different survey methods

Muhammad Iqbal¹, Indra Yustian², Arum Setiawan², Rahmat Pratama Abdullah³ and Muhammad Isa⁴

Corresponding author: Muhammad Iqbal, Email: kpbsos26@yahoo.com

ABSTRACT

A rapid bird survey was carried out in Bukit Puar, Kerinci Seblat National Park, South Sumatra Province. Three survey methods were applied to asses bird diversity in this area: transect line, mist-netting and riparian survey. A total of 53 species from A total of 53 species from 27 families was recorded during survey. Among three methods applied, transect line is the most effective method to detect more bird species (45 species), followed by mist-netting (14 species) and riparian survey (nine species). There are 10 species are protected by Indonesia law and five birds are listed as Near Threatened (NT) by International Union for Conservation of Nature or IUCN. These findings shows that Bukit Puar still good habitat for various of birds, and the forest remaining should be protected.

ABSTRAK

Sebuah survei cepat untuk mengetahui keragaman burung telah dilakukan di Bukit Puar, Taman Nasional Kerinci Seblat, Provinsi Sumatera Selatan. Tiga metode survey digunakan dalam survey ini, yaitu: jalur transek (transect line), mist-netting dan survei dengan menyusuri sungai (riparian survey). Tercatat 53 jenis jenis burung dari 27 famil dalam survei ini. Dari ketiga metode yang digunakan, metode jalur transek merupakan metode yang paling efektif untuk mendeteksi lebih banyak keragaman burung dengan 45 jenis, diikuti mist-netting dengan 14 jenis dan survei menyusuri sungai dengan 9 jenis. Tercatat juga 10 jenis merupakan jenis dilindungi oleh Pemerintah Indonesia dan lima jenis masuk dalam kategori terancam punah menurut International Union for Conservation of Nature atau IUCN. Hasil dari survei ini menunjukkan bahwa Bukit Puar masih merupakan habitat yang baik untuk keragaman burung, dan hutan yang masih tersisa disini sebaiknya tetap dilindungi.

Keywords: Bird, Bukit Puar, Kerinci Seblat National Park, transect line, mist-netting, riparian survey

Introduction

Kerinci Seblat National Park (KSNP) with a total area of 1.389.509ha (Kepmenhut No.420/Menhut-II/2004) is a largest National Park in Sumatra, spanning over four provinces: West Sumatra, Jambi, Bengkulu and South Sumatra (Anon, 2016). The area has great habitats diversity that spans over continuous forest from lowlands to montane, including some natural stands of tropical pine (MacKinnon and Philipps, 1993). KSNP has

Submitted 21st October, 2016. Accepted 26th February, 2017

been listed as an Important Bird Area (IBA), an Endemic Bird Area and World Heritage Site in Indonesia (Anon, 2016; Holmes and Rombang, 2001; Stattersfield, 1998). The park shelters several important populations of Sumatra's charismatic wildlife, including many Sumatran endemic birds (Cochrane and Cubitt, 2004; Myers, 2005).

The avian diversity in KSNP and adjacent areas comprises over 380 species, which include 17 of the 20 Sumatran endemics (Anon, 2002). Most ornithological exploration of KSNP have taken place in the central parts of the park or in areas adjacent to Gunung Kerinci (eg. Holden, 1997; Hurrel, 1989; Lambert and Howes, 1989; Simpson,

1995), whereas information about avifauna outside these areas remains little known. In South Sumatra, an area of 250.613ha of KNSP, the avifauna remains unstudied (Anon, 2016).

Bukit Puar is a hilly forest in a part of KSNP that is located in the province of South Sumatra, where the habitat remains relatively intact, yet with no information available on the fauna in Bukit Puar, including its bird diversity. This survey is the first bird diversity survey to be undertaken in the Bukit Puar area of KSNP.

Methods

Study Area

The survey took place around Bukit Puar and its adjacent areas (02° 47'S, 102°23'E) in KSNP (Fig. 1). The survey took place in approx 500ha of Bukit Puar. The area is under management area of subsection V or SPTN V (SPTN = Seksi Pengelolaan Taman Nasional Wilayah) of KSNP. Administratively, the site is located in Muara Kulam village, South Sumatra province. It consists of secondary dipterocarp forest with little encroachment, apart from low intensity selective illegal logging by local people. The topography is hilly with numerous riparian areas (Fig. 2).

Survevs

From 18-22nd April 2016, three survey were undertaken to rapidly asses the bird diversity in Bukit Puar. We applied standard methods for conducting survey, following protocols for rapid survey of terrestrial birds (eg. Bibby et al., 2000; Herzog et al., 2011). The survey methods used were line transect, mist-netting and survey by canoe along riparian zones. Identification of birds were done with the aid of field guides, mainly of MacKinnon and Phillipps (1993).

Figure 2. Bukit Puar consists of hilly secondary dipterocarp forest with little encroachment ©Muhammad Iqbal.

Five fixed-radius 100 m transect line surveys were conducted between sunrise to mid-morning. We recorded distance from observer (≤ 50 m or > 50 m, and time of observation of all birds that could be identified either based on vocalisation or direct observation.

Five mist-nets (15 x 3m, 3-4mm mesh) were deployed in the survey area. The nets were stretched between two poles and checked every two hours, or four times a day. Birds caught in the mist-nets were removed and placed in a cage for identification and morphometric measures.

Access to Bukit Puar from Muara Kulam village took place in canoe powered by a 15Hp outboard motor. This time was used to record birds and other wildlife along the river. A total of 6km over a duration of two hours was undertaken for riparian surveys around Bukit Puar and surrounding area.

RESULTS AND DISCUSSION

A total of 53 species from 27 families (taxonomy, scientific name and English name follow Sukmantoro

et al., 2007) was recorded during survey (Table 1). Among the three survey methods used, transect line survey resulted in most recordings (45 species), followed by mist-netting (14 species) and riparian zones survey (nine species). Only one observation of the Greater racquet-tailed drongo was recorded across all three survey methods.

From 53 species recorded in Bukit Puar, 10 species are protected by Indonesia law (Noerdjito and Maryanto, 2001), and five species are listed as Near Threatened (NT) on the IUCN red-list (Birdlife International, 2016). Rufous-collared kingfisher is the only species recorded that is listed as both protected and NT.

Whereas the transect line resulted in more species of recorded birds (85% of total), mistnetting is an important tool to detect shy illusive species, such as small birds from the under-storey community (Rahman, 2002; Whitman et al., 1997). In this survey, mist-nets captured four species that were not recorded by the other survey methods: Green broadbill, Hooded pitta, Banded pitta and Chestnut-rumped babbler. The Green broadbill is a good sample of why mist-netting is important too.

Table 1. A list of species recorded during 18-22 April 2016, and methods use to detect the occurrence of birds in Bukit Puar, Kerinci Seblat National Park. P = Protected by Indonesian law, NT = Near threatened (IUCN red-list status), 1 = Transect line, 2 = Mist-netting, 3 = Riparian survey with canoe.

While Green broadbill is a common bird, it is often overlooked due to its behaviour, where it is often found stationary in the middle and high canopy and almost invisible (MacKinnon and Phillipps, 1993). For rapid bird censuses, however, transects line surveys are preferred to get an indication of species richness and abundance, since this method is less costly, less invasive, and less time-consuming (Arizaga et al., 2011).

As tropical landscapes become increasingly and human-dominated, deforested, fragmented riparian zones are becoming disproportionally important in connecting and harbouring populations of tropical forest organisms (Sekercioglu 2009). In South Sumatra, a bird survey was undertaken in Merang peat dome areas and Sembilang National Park (Goenner and Hasudungan, 2001, Iqbal, 2004, Waltert, 2008). Although surveys in riparian zones often result in low number of bird species, it is an important habitat that must be included in general biodiversity assessments. In this survey, we recorded three species Crested serpent eagle, Buffy fish owl and Ficedula flycatcher, that were not found elsewhere.

Birds are ideal subjects to assess an area for rapid biodiversity surveys, since they are the best known group of organisms in term of their taxonomy, biology, ecology, biogeography and conservation status (Herzog et al. 2011). Our studies in Bukit Puar suggest that the area is an important habitat for a range of bird species.

ACKNOWLEDGEMENT

We thank GIZ Bioclime for funding this study. We are very grateful to Dr. Carl Traeholt and Dr. Wilson Novarino for their constructive suggestions and advises. Finally, thanks to our Muara Kulam biodiversity team who have valuable contribution: Doni Setiawan, Catur Prasetyo, Deny Noberio Gusna, Ina Aprilia, Rio Firman and Winda Indriati.

GUIDELINES FOR AUTHORS

The Journal of Indonesian Natural History will publish original work by:

- Indonesian or foreign scientists on any aspect of Indonesian natural history, including fauna, flora, habitats, management policy and use of natural resources
- Indonesian or foreign scientists on any aspect of regional natural history, including fauna, flora and habitats

Preference is given to material that has the potential to;

- Improve conservation intervention and management in Indonesia
- · Enhances understanding of conservation needs in Indonesia
- Enhances the understanding of Indonesia's natural history

The Journal language will be in English with abstracts in Bahasa Indonesia as well as English. Authors of full papers are encouraged to provide a Bahasa Indonesia/English translation of their abstract. Submissions in Bahasa Indonesia will be accepted and translated into English only if accepted for publication.

Papers and Short Communications

Full Research Papers (2,000-7,000 words) and Short Communications (200-2,000 words) are invited on topics relevant to the Journal's focus, including:

- The conservation status, ecology or behaviour of wild species
- Status or ecology of habitats
- Prehistoric and extinct species and new findings
- Checklists of species, nationally or for a specific area
- Discoveries of new species records or range extensions.
- Biodiversity value associated with land use change, plantation development and forestry
- Biodiversity in High Conservation Value areas
- Reviews of conservation policy and legislation
- Conservation management plans for species, habitats or areas
- The nature and results of conservation initiatives, including case studies
- Sustainable use of wild species
- Community use and management of natural resources
- Abstracts of unpublished student theses (Short Communications only)

The Journal will not accept descriptions of new species, subspecies or other taxa.

How to Submit a Manuscript

Manuscripts should be submitted by e-mail to the Editor at:

editorjinh@jinh.org

In the covering e-mail, the Lead Author must confirm that:

- The submitted manuscript has not been published elsewhere,
- All of the authors have read the submitted manuscript and agreed to its submission,
- All research was conducted with the necessary approval and permits from the appropriate authorities

Review and editing

All contributors in English are strongly advised to ensure that their spelling and grammar is checked by a native English speaker before the manuscript is submitted to the Journal. The Editorial Team reserves the right to reject manuscripts that are poorly written.

Submission in Bahasa Indonesia is also accepted and the Journal secretariat will undertake a preliminary review of all manuscripts for suitability of content and format. Manuscripts that are rejected at this stage will not be sent for peer review and translation.

Manuscripts that pass through the preliminary review will be sent for translation and peer review by a minimum of two reviewers. Authors are welcome to suggest appropriate reviewers.

Proofs will be sent to authors as a portable document format (PDF) file attached to an e-mail note. PDF-readers can be downloaded free of charge from http://www.adobe.com and http://www.nitropdf.com for viewing PDF files. Corrected proofs should be returned to the Editor within 3 days of receipt. Minor corrections can be communicated by e-mail.

The Editorial Team also welcomes contributions to the other sections of the journal:

News

Concise reports (<300 words) on news of general interest to the study and conservation of Indonesia's natural history. News reports may include,

- Announcements of new initiatives; for example, the launch of new projects, conferences or funding opportunities.
- Announcements of important new reports or other publications related to Indonesian natural history.
- Summaries of important news from an authoritative published source; for example, new Indonesian species described in other journals, a new research technique, or a recent development in conservation.
- Summaries and analysis of new policies, decrees and laws relevant to the conservation of Indonesian natural history.

Letters to the Editor

Informative contributions (<650 words) in response to material published in the Journal.

Preparation of manuscripts

Full papers follow the style and format of papers published in the journal Conservation Biology. Authors should consult examples in Conservation Biology for guidance on general style.

Contributions should be in Bahasa Indonesia and/or UK English, double-spaced and in 'doc, 'rtf' or 'wpd' format, preferably as one file attached to one covering e-mail.

The cover page should contain;

The title and full mailing address, e-mail address and address of the Lead Author and all additional authors.

Contributing Papers should contain the following sections and be arranged in the following order: Abstract, Introduction, Methods, Results, Discussion, Acknowledgments, Literature Cited. Tables,

Figures and Plates (including legends), if included, should follow the Literature Cited.

All pages should be numbered consecutively. Do not number section headings or subheadings.

Title: This should be a succinct description of the work, in no more than 20 words.

Abstract: Abstracts should only be submitted for Full Papers. This should describe, in 100-300 words, the aims, methods, major findings and conclusions. It should be informative and intelligible without reference to the text, and should not contain any references or undefined abbreviations. Authors are encouraged to submit an English translation of Indonesian text and an Indonesian translation of an English text.

Keywords: From five to eight pertinent words, in alphabetical order.

Literature cited in text: Enclose citations in text in parentheses e.g. "Asian tapirs are no elephants when it comes to seed dispersal (Campos-Arceiz et al., 2011)."

Use an ampersand (&) between author surnames when the citation is parenthetical: (Traeholt & Idris, 2011).

When a citation is not parenthetical, use "and": "Our results agree with the predictions of Wolf and Rhymer (2001)."

For citations with more than two authors, use et al.: (Campos-Arceiz et al., 2011). Do not italicize et al.

List parenthetical citations in alphabetical order and chronologically from oldest to most recent and separate entries with a semicolon: (Campos-Arceiz et al., 2011; Geissman, 2009, 2010).

Separate the years with commas when citing multiple papers by the same author: (Corlett, 2007, 2010; Geissman, 1984, 1995, 1999, 2000).

"In press" means the cited paper has been accepted unconditionally for publication. Provide the year of publication in the text (Bird, 2010) and in Literature Cited section provide the volume number, and substitute "in press" for page numbers (Bird, I.M. 2010. Nesting success in arid lands. Conservation Biology 24: in press.).

Papers in review must be cited as unpublished and should not appear in the Literature Cited section.

Use an initial for the first (given) name and spell out the last name (surname) for other sources of unpublished data or information: (R. Fowler, unpublished data; M.E. Soulé, personal communication).

Software: capitalize the first letter only if the name of the program is a word (e.g., Vortex, ArcGIS). If the name of the program is not a word, use all capital letters (e.g., SAS).

The following are examples of Literature Cited house style:

Campos-Arceiz, A. and R.T. Corlett (2011). Big animals in a shrinking world—studying the ecological role of Asian megafauna as agents of seed dispersal. Innovation 10: 50–53.

Campos-Arciez, A., Larringa, A.R., Weerasinghe, U.R., Takatsuki, S.,

Pastorini, J., Leimgruber, P., Fernando, P. and L. Santamaria (2008). Behavior rather than diet mediates seasonal differences in seed dispersal by Asian elephants. Ecology 89: 2684–2691.

MacArthur, R.H. & Wilson, E.O. (1967). The Theory of Island Biogeography. Princeton University Press, Princeton, USA.

Sutherland, W.J. (ed.) (1998). Conservation Science and Action. Blackwell Science, Oxford, UK.

Beck, B.B., Rapaport, L.G. & Stanley Price, M.R. (1994). Reintroduction of captive-born animals. In Creative Conservation: Interactive Management of Wild and Captive Animals (eds P.J.S. Olney, G.M. Mace & A.T.C. Feistner), pp. 265-286. Chapman & Hall, London, UK.

Traeholt, C., Bonthoeun, R., Rawson, B., Samuth, M., Virak, C. and Sok Vuthin (2005). Status review of pileated gibbon, *Hylobates pileatus* and yellow-cheeked crested gibbon, *Nomascus gabriellae*, in Cambodia. Fauna & Flora International, Phnom Penh, Cambodia.

Sun H. (2000). Status of the tiger and its conservation in Cambodia. MSc thesis, University of Minnesota, Minneapolis, USA.

IUCN (2010). 2010 IUCN Red List of Threatened Species. Http://www.redlist.org [accessed 1 February 2011].

Biography: This should describe the main research interests of all authors (<150 words total), apart from what is obvious from the subject of the manuscript and the authors' affiliations.

Tables, figures and plates: These should be self-explanatory, each on a separate page and with an appropriate caption. Figures can be submitted in colour as well as in black and white. The Editorial Team may decide to convert coloured figures into black and white should it be necessary due to printing cost and without diluting the message. Plates (black and white only) will only be included in an article if they form part of evidence that is integral to the subject studied (e.g., a photograph of a rare species), if they are of good quality, and if they do not need to be printed in colour.

Appendices: Lengthy tables, and questionnaires are discouraged. In special circumstances these may be made available for viewing online.

Species names: The first time a species is mentioned, its scientific name should follow in parenthesis and in italics: e.g., Asian elephant (Elephas maximus). English names should be in lower case throughout except where they incorporate a proper name (e.g., Asian elephant, Cookson's wildebeest, long-billed vulture).

Abbreviations: Full expansion should be given at first mention in the text.

Units of measurement: Use metric units only for measurements of area, mass, height, etc.

ABSTRACT

A rapid bird survey was carried out in Bukit Puar, Kerinci Seblat National Park, South Sumatra Province. Three survey methods were applied to asses bird diversity in this area: transect line, mist-netting and riparian survey. A total of 53 species from A total of 53 species from 27 families was recorded during survey. Among three methods applied, transect line is the most effective method to detect more bird species (45 species), followed by mist-netting (14 species) and riparian survey (nine species). There are 10 species are protected by Indonesia law and five birds are listed as Near Threatened (NT) by International Union for Conservation of Nature or IUCN. These findings shows that Bukit Puar still good habitat for various of birds, and the forest remaining should be protected.

ABSTRAK

Sebuah survei cepat untuk mengetahui keragaman burung telah dilakukan di Bukit Puar, Taman Nasional Kerinci Seblat, Provinsi Sumatera Selatan. Tiga metode survey digunakan dalam survey ini, yaitu: jalur transek (transect line), mist-netting dan survei dengan menyusuri sungai (riparian survey). Tercatat 53 jenis jenis burung dari 27 famil dalam survei ini. Dari ketiga metode yang digunakan, metode jalur transek merupakan metode yang paling efektif untuk mendeteksi lebih banyak keragaman burung dengan 45 jenis, diikuti mist-netting dengan 14 jenis dan survei menyusuri sungai dengan 9 jenis. Tercatat juga 10 jenis merupakan jenis dilindungi oleh Pemerintah Indonesia dan lima jenis masuk dalam kategori terancam punah menurut International Union for Conservation of Nature atau IUCN. Hasil dari survei ini menunjukkan bahwa Bukit Puar masih merupakan habitat yang baik untuk keragaman burung, dan hutan yang masih tersisa disini sebaiknya tetap dilindungi.

Keywords: Bird, Bukit Puar, Kerinci Seblat National Park, transect line, mist-netting, riparian survey

Introduction

Kerinci Seblat National Park (KSNP) with a total area of 1.389.509ha (Kepmenhut No.420/Menhut-II/2004) is a largest National Park in Sumatra, spanning over four provinces: West Sumatra, Jambi, Bengkulu and South Sumatra (Anon, 2016). The area has great habitats diversity that spans over continuous forest from lowlands to montane, including some natural stands of tropical pine (MacKinnon and Philipps, 1993). KSNP has

Submitted 21st October, 2016. Accepted 26th February, 2017

been listed as an Important Bird Area (IBA), an Endemic Bird Area and World Heritage Site in Indonesia (Anon, 2016; Holmes and Rombang, 2001; Stattersfield, 1998). The park shelters several important populations of Sumatra's charismatic wildlife, including many Sumatran endemic birds (Cochrane and Cubitt, 2004; Myers, 2005).

The avian diversity in KSNP and adjacent areas comprises over 380 species, which include 17 of the 20 Sumatran endemics (Anon, 2002). Most ornithological exploration of KSNP have taken place in the central parts of the park or in areas adjacent to Gunung Kerinci (eg. Holden, 1997; Hurrel, 1989; Lambert and Howes, 1989; Simpson,

1995), whereas information about avifauna outside these areas remains little known. In South Sumatra, an area of 250.613ha of KNSP, the avifauna remains unstudied (Anon, 2016).

Bukit Puar is a hilly forest in a part of KSNP that is located in the province of South Sumatra, where the habitat remains relatively intact, yet with no information available on the fauna in Bukit Puar, including its bird diversity. This survey is the first bird diversity survey to be undertaken in the Bukit Puar area of KSNP.

Surveys

From 18-22nd April 2016, three survey were undertaken to rapidly asses the bird diversity in Bukit Puar. We applied standard methods for conducting survey, following protocols for rapid survey of terrestrial birds (eg. Bibby et al., 2000; Herzog et al., 2011). The survey methods used were line transect, mist-netting and survey by canoe along riparian zones. Identification of birds were done with the aid of field guides, mainly of MacKinnon and Phillipps (1993).

METHODS

Study Area

The survey took place around Bukit Puar and its adjacent areas (02° 47'S, 102°23'E) in KSNP (Fig. 1). The survey took place in approx 500ha of Bukit Puar. The area is under management area of subsection V or SPTN V (SPTN = Seksi Pengelolaan Taman Nasional Wilayah) of KSNP. Administratively, the site is located in Muara Kulam village, South Sumatra province. It consists of secondary dipterocarp forest with little encroachment, apart from low intensity selective illegal logging by local people. The topography is hilly with numerous riparian areas (Fig. 2).

Figure 2. Bukit Puar consists of hilly secondary dipterocarp forest with little encroachment ©Muhammad Iqbal.

Five fixed-radius 100 m transect line surveys were conducted between sunrise to mid-morning. We recorded distance from observer (≤ 50 m or > 50 m, and time of observation of all birds that could be identified either based on vocalisation or direct observation.

Five mist-nets (15 x 3m, 3-4mm mesh) were deployed in the survey area. The nets were stretched between two poles and checked every two hours, or four times a day. Birds caught in the mist-nets were removed and placed in a cage for identification and morphometric measures.

Access to Bukit Puar from Muara Kulam village took place in canoe powered by a 15Hp outboard motor. This time was used to record birds and other wildlife along the river. A total of 6km over a duration of two hours was undertaken for riparian surveys around Bukit Puar and surrounding area.

RESULTS AND DISCUSSION

A total of 53 species from 27 families (taxonomy, scientific name and English name follow Sukmantoro

et al., 2007) was recorded during survey (Table 1). Among the three survey methods used, transect line survey resulted in most recordings (45 species), followed by mist-netting (14 species) and riparian zones survey (nine species). Only one observation of the Greater racquet-tailed drongo was recorded across all three survey methods.

From 53 species recorded in Bukit Puar, 10 species are protected by Indonesia law (Noerdjito and Maryanto, 2001), and five species are listed as Near Threatened (NT) on the IUCN red-list (Birdlife International, 2016). Rufous-collared kingfisher is the only species recorded that is listed as both protected and NT.

Whereas the transect line resulted in more species of recorded birds (85% of total), mistnetting is an important tool to detect shy illusive species, such as small birds from the under-storey community (Rahman, 2002; Whitman et al., 1997). In this survey, mist-nets captured four species that were not recorded by the other survey methods: Green broadbill, Hooded pitta, Banded pitta and Chestnut-rumped babbler. The Green broadbill is a good sample of why mist-netting is important too.

Table 1. A list of species recorded during 18-22 April 2016, and methods use to detect the occurrence of birds in Bukit Puar, Kerinci Seblat National Park. P = Protected by Indonesian law, NT = Near threatened (IUCN red-list status), 1 = Transect line, 2 = Mist-netting, 3 = Riparian survey with canoe.

While Green broadbill is a common bird, it is often overlooked due to its behaviour, where it is often found stationary in the middle and high canopy and almost invisible (MacKinnon and Phillipps, 1993). For rapid bird censuses, however, transects line surveys are preferred to get an indication of species richness and abundance, since this method is less costly, less invasive, and less time-consuming (Arizaga et al., 2011).

As tropical landscapes become increasingly deforested, fragmented and human-dominated, riparian zones are becoming disproportionally important in connecting and harbouring populations of tropical forest organisms (Sekercioglu 2009). In South Sumatra, a bird survey was undertaken in Merang peat dome areas and Sembilang National Park (Goenner and Hasudungan, 2001, Iqbal, 2004, Waltert, 2008). Although surveys in riparian zones often result in low number of bird species, it is an important habitat that must be included in general biodiversity assessments. In this survey, we recorded three species Crested serpent eagle, Buffy fish owl and Ficedula flycatcher, that were not found elsewhere.

Birds are ideal subjects to assess an area for rapid biodiversity surveys, since they are the best known group of organisms in term of their taxonomy, biology, ecology, biogeography and conservation status (Herzog et al. 2011). Our studies in Bukit Puar suggest that the area is an important habitat for a range of bird species.

ACKNOWLEDGEMENT

We thank GIZ Bioclime for funding this study. We are very grateful to Dr. Carl Traeholt and Dr. Wilson Novarino for their constructive suggestions and advises. Finally, thanks to our Muara Kulam biodiversity team who have valuable contribution: Doni Setiawan, Catur Prasetyo, Deny Noberio Gusna, Ina Aprilia, Rio Firman and Winda Indriati.
