## SUMMARY

**DWI SEFTIYANI PUTRI.** Effect of Artificial Bulk Density and Granting Liquid Organic Fertilizer (LOF), Palm Oil Mill Effluent (POME), Waste Leachate On Crop Production Caisim (*Brasicca chinensis*) (Supervised by **BAKRI** and **ADIPATI NAPOLEON**).

This research was conducted at the Greenhouse of Soil Departement, Faculty of Agriculture, Sriwijaya University. Implementation of the research conducted from July to October 2013. This research aims to determine the liquid organic fertilizer, palm oil mill effluent, garbage leachate, artificially bulk density on crop production caisim (*Brasicca chinensis*), as well as the interaction between the liquid fertilizer and bulk density on crop production artificially caisim. Soil bulk density analysis conducted at the Laboratory of Chemistry, Biology and Soil Fertility, Soil Departement Faculty of Agriculture, Sriwijaya University Indralaya. The method used in this research is Rondomized Complete Design with 2 factors treatments and two replications, namely: 1. Liquid Fertilizer ( $P_0$  = Control,  $P_1$  = Liquid Organik Fertilizer (LOF),  $P_2$  = Palm Oil Mill Effluent (POME),  $P_3$  = Waste Leachate), and 2. Weight Land Contents ( $B_1 = 1,1 \text{ gr/cm}^3$ ,  $B_2 = 1,0 \text{ gr/cm}^3$ ,  $B_3 = 0,9 \text{ gr/cm}^3$ ). Each treatment combination was repeated 3 times, so total of 36 treatment.

The results showed that an liquid fertilizer did not significantly affect the formation of soil bulk density that is conditioned on the initial state, as well as liquid fertilizer had no significant effect on crop production.

Key Words : *Bulk Density, Liquid Fertilizer, Caisim.*
